1 Introduction

1.1 Goal of this document
This configuration guide describes how to configure TheGreenBow IPSec VPN Client software with a Cisco RV 120W Wireless-N VPN Firewall to establish VPN connections for remote access to corporate network.

1.2 VPN Network topology
In our VPN network example (diagram hereafter), we will connect TheGreenBow IPSec VPN Client software to the LAN behind the Cisco RV 120W VPN Firewall. The VPN Client is connected to the Internet with a DSL connection or through a LAN. All the addresses in this document are given for example purpose.

1.3 Cisco RV 120W VPN Gateway
Our tests and VPN configuration have been conducted with Cisco RV 120W firmware release 1.0.0.12.

1.4 Cisco RV 120W VPN Gateway product info

|---------------------------|--------------------------------------------------------------------------------------------------|
2 Cisco RV 120W VPN configuration

This section describes how to build an IPSec VPN configuration with your Cisco RV 120W Wireless-N VPN Firewall.

Once connected to your Cisco RV 120W VPN gateway, you must select “VPN”, “IPSec” and “IPSec Policies” tabs.

Click on ‘Add’ IKE Policies Table to setup IKE SA parameters including Pre-shared key, encryption and authentication algorithms.

We’ll be configuring the same Pre-shared key for all employees (users) and User Authentication will be based on X-Auth taking advantage of the Cisco RV 120W Wireless-N VPN Firewall internal user data base.
2.1 Cisco RV 120W IKE Policies

Consider the Pre-shared key as the mean to identify all employee computers as part of your company or authorize to talk to your router (i.e. same key for everyone), and the Extended Authentication section based on X-Auth as a mean to authenticate a specific user within your company.

Remember those settings; we’ll use the same in the VPN Client. Click ‘Save’.
2.2 Cisco RV 120W VPN Policies

Go back to ‘VPN’ > ‘IPSec’ > ‘IPSec Policies’ left menu and click on ‘Add’ VPN Policies Table to setup network and IP address parameters.

Remember those settings; we'll use the same in the VPN Client. Click ‘Save’.
As a result, you should get a policy for both IKE Policies Table and VPN Policies Table.
2.3 Create Users in internal Cisco RV 120W database

Go back to 'VPN' > 'IPSec' left menu and go to 'IPSec Users' tab to employees to the data base. Then click on 'Add'.

Remember those settings; we'll use the same in the VPN Client. Click 'Save'.
3 TheGreenBow IPSec VPN Client configuration

This section describes the required configuration to connect to a Cisco RV 120W VPN router via VPN connections.

To download the latest release of TheGreenBow IPSec VPN Client software, please go to http://www.thegreenbow.com/vpn_down.html.

3.1 VPN Client Phase 1 (IKE) Configuration

You may use either Preshared key, Certificates, USB Tokens, OTP Token (One Time Password) or X-Auth combined with RADIUS Server for User Authentication with the Cisco RV 120W router. This configuration is one example of what can be accomplished in term of User Authentication. You may want to refer to either the Cisco RV 120W router user guide or TheGreenBow IPSec VPN Client software User Guide for more details on User Authentication options.
3.2 VPN Client Phase 1 Advanced

Please force Aggressive mode and X-Auth User Authentication.

3.3 VPN Client Phase 2 (IPSec) Configuration

- Enter the IP address (and subnet mask) of the remote LAN.
- VPN Client Virtual IP address
3.4 Open IPSec VPN tunnels

Once both Cisco RV 120W router and TheGreenBow IPSec VPN Client software have been configured accordingly, you are ready to open VPN tunnels. First make sure you enable your firewall with IPSec traffic.

1. Click on "Save & Apply" to take into account all modifications we've made on your VPN Client configuration.
2. Click on "Open Tunnel" to open a secure IPSec VPN Tunnel.
3. Once the X-Auth popup window appears, enter the X-Auth credentials and click on "OK".

4. Select "Connections" to see opened VPN Tunnels.
5. Select "Console" if you want to access to the IPSec VPN logs and adjust filters to display less IPSec messaging. The following example shows a successful connection between TheGreenBow IPSec VPN Client and a Cisco RV 120W Wireless-N VPN Firewall.

```
[2010-05-11] 16:07:14 Default [SA Gateway] P1 SEND phase 1 Aggressive Mode [SA] [KEY_EXCH] [NONCE] [ID] [MD5] [ID] [MD5] [ID] [MD5]
[2010-05-11] 16:07:14 Default [SA Gateway] P1 RECV phase 1 Aggressive Mode [HASH] [SA] [KEY_EXCH] [NONCE] [ID] [MD5] [ID] [MD5] [ID] [MD5]
[2010-05-11] 16:07:14 Default [SA Gateway] P1 SEND phase 1 Aggressive Mode [HASH] [NAT_D] [NAT_D]
[2010-05-11] 16:07:27 Default [SA Gateway] P1 SEND phase 2 Quick Mode [HASH] [SA] [KEY_EXCH] [NONCE] [ID] [ID]
[2010-05-11] 16:10:28 Default [SA Gateway] P1 SEND phase 2 Quick Mode [HASH] [SA] [KEY_EXCH] [NONCE] [ID] [ID]
[2010-05-11] 16:10:28 Default [SA Gateway] P1 SEND phase 2 Quick Mode [HASH] [SA] [KEY_EXCH] [NONCE] [ID] [ID]
```
4 Tools in case of trouble

Configuring an IPSec VPN tunnel can be a hard task. One missing parameter can prevent a VPN connection from being established. Some tools are available to find source of troubles during a VPN establishment.

4.1 A good network analyser: Wireshark

Wireshark is a free software that can be used for packet and traffic analysis. It shows IP or TCP packets received on a network card. This tool is available on website http://www.wireshark.org. It can be used to follow protocol exchange between two devices. For installation and use details, read its specific documentation (http://www.wireshark.org/docs/).
5 VPN IPSec Troubleshooting

5.1 « PAYLOAD MALFORMED » error (wrong Phase 1 [SA])

If you have an « PAYLOAD MALFORMED » error you might have a wrong Phase 1 [SA], check if the encryption algorithms are the same on each side of the VPN tunnel.

5.2 « INVALID COOKIE » error

If you have an « INVALID COOKIE » error, it means that one of the endpoint is using a SA that is no more in use. Reset the VPN connection on each side.

5.3 « no keystate » error

Check if the preshared key is correct or if the local ID is correct (see « Advanced » button). You should have more information in the remote endpoint logs.

5.4 « received remote ID other than expected » error

The « Remote ID » value (see « Advanced » Button) does not match what the remote endpoint is expected.
5.5 « NO PROPOSAL CHOSEN » error

If you have an « NO PROPOSAL CHOSEN » error, check that the « Phase 2 » encryption algorithms are the same on each side of the VPN Tunnel.

Check « Phase 1 » algorithms if you have this:

5.6 « INVALID ID INFORMATION » error

If you have an « INVALID ID INFORMATION » error, check if « Phase 2 » ID (local address and network address) is correct and match what is expected by the remote endpoint.

Check also ID type (“Subnet address” and “Single address”). If network mask is not check, you are using a IPV4_ADDR type (and not a IPV4_SUBNET type).

5.7 I clicked on “Open tunnel”, but nothing happens.

Read logs of each VPN tunnel endpoint. IKE requests can be dropped by firewalls. An IPSec Client uses UDP port 500 and protocol ESP (protocol 50).

5.8 The VPN tunnel is up but I can’t ping !

If the VPN tunnel is up, but you still cannot ping the remote LAN, here are a few guidelines:

- Check Phase 2 settings: VPN Client address and Remote LAN address. Usually, VPN Client IP address should not belong to the remote LAN subnet
- Once VPN tunnel is up, packets are sent with ESP protocol. This protocol can be blocked by firewall. Check that every device between the client and the VPN server does accept ESP
- Check your VPN server logs. Packets can be dropped by one of its firewall rules.
- Check your ISP support ESP
• If you still cannot ping, follow ICMP traffic on VPN server LAN interface and on LAN computer interface (with Wireshark for example). You will have an indication that encryption works.
• Check the “default gateway” value in VPN Server LAN. A target on your remote LAN can receive pings but does not answer because there is a no “Default gateway” setting.
• You cannot access to the computers in the LAN by their name. You must specify their IP address inside the LAN.
• We recommend you to install Wireshark (http://www.wireshark.org) on one of your target computer. You can check that your pings arrive inside the LAN.
