1 Introduction

1.1 Goal of this document

This configuration guide describes how to configure TheGreenBow IPSec VPN Client with a Linksys BEFVP41 router.

1.2 VPN Network topology

In our VPN network example (diagram hereafter), we will connect TheGreenBow IPSec VPN Client to the LAN behind the Linksys BEFVP41 router. The VPN client is connected to the Internet with a DSL connection or through a LAN. All the addresses in this document are given for example purpose.

![VPN Network Diagram]

1.3 Linksys BEFVP41 Restrictions

No known restrictions.
2 Linksys BEFVP41 Configuration

This section describes how to build an IPSec VPN configuration with your Linksys BEFVP41 VPN router.

Once connected to your VPN gateway, you must select “Security” and “VPN” tabs.

After defining “VPN tunnel” attributes and "VPN name", you must fill in Linksys LAN IP subnet address in “Local Secure group" section.
You must select “Any” in “Remote Secure Group” and “Remote Security Gateway” sections because you are using an IPSec VPN client.

Make sure you remember IPSec / IKE encryption, authentication algorithms and pre shared key as you’ll need them to configure TheGreenBow IPSec VPN Client side. For example, 3DES and SHA combination.

When selecting “Advanced settings” on your Linksys BEFVP41 router, you will find this panel:

Note these IPSec values. Make sure you remember IPSec / IKE Phase1 and Phase 2 attributes as you’ll need them to configure TheGreenBow IPSec VPN Client side.

If you choose “Main mode”, Phase 1 IDs will be IP address. Any IP address will be accepted as Phase 1 identity by the VPN gateway.

If you choose “Aggressive mode”, Phase 1 ID will be an email address. Only phase 1 identity with email specified in “Username” will be accepted by the VPN gateway.
3 TheGreenBow IPSec VPN Client configuration

3.1 VPN Client Phase 1 (IKE) Configuration

Phase 1 configuration

In "Advanced" window, we set up nothing unless you have chosen "Aggressive" mode in the configuration of the Linksys BEFVP41. In that case, you shall select "Aggressive" there and add the username you have chosen in the Linksys configuration in "Local ID" value and select "email" as "Type" value.
3.2 VPN Client Phase 2 (IPSec) Configuration

You may define a static virtual IP address here. If you use 0.0.0.0, you will have error “Local-ID” is missing. It does not prevent you from establishing a VPN tunnel.

Enter the IP address (and subnet mask) of the remote LAN.

Phase 2 Configuration

3.3 Open the IPSec VPN tunnels

Once both Linksys BEFV41 router and TheGreenBow IPSec VPN Client have been configured accordingly, you are ready to open VPN tunnels. First make sure you enable your firewall with IPSec traffic.

1. Click on “Save & Apply” to take into account all modifications we’ve made on your VPN Client configuration

2. Click on “Open Tunnel”, or generate traffic that will automatically open a secure IPsec VPN Tunnel (e.g. ping, IE browser)

3. Select “Connections” to see opened VPN Tunnels

4. Select “Console” if you want to access to the IPSec VPN logs and adjust filters to display less IPSec messaging.
4 VPN IPSec Troubleshooting

4.1 « PAYLOAD MALFORMED » error

If you have an « PAYLOAD MALFORMED » error you might have a wrong Phase 1 [SA], check if the encryption algorithms are the same on each side of the VPN tunnel.

4.2 « INVALID COOKIE » error

If you have an « INVALID COOKIE » error, it means that one of the endpoint is using a SA that is no more in use. Reset the VPN connection on each side.

4.3 « no keystate » error

Check if the preshared key is correct or if the local ID is correct (see « Advanced » button). You should have more information in the remote endpoint logs.

4.4 « received remote ID other than expected » error

The « Remote ID » value (see « Advanced » Button) does not match what the remote endpoint is expected.
4.5 « NO PROPOSAL CHOSEN » error

115911 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [SA][VID]
115913 Default (SA BEFVP41-P1) RECV phase 1 Main Mode [SA][VID]
115913 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [KEY][NONCE]
115915 Default (SA BEFVP41-P1) RECV phase 1 Main Mode [KEY][NONCE]
115915 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [ID][HASH][NOTIFY]
115915 Default (SA BEFVP41-P1) RECV phase 1 Main Mode [ID][HASH][NOTIFY]
115915 Default phase 1 done: initiator id c364cd70: 195.100.205.112, responder id c364cd72: 195.100.205.114, src: 195.100.205.112 dst: 195.100.205.114
115915 Default (SA BEFVP41-BEFVP41-P2) SEND phase 2 Quick Mode [SA][KEY][ID][HASH][NONCE]
115915 Default RECV Informational [HASH][NOTIFY] with NO_PROPOSAL_CHOSEN error
115915 Default RECV Informational [HASH][DEL]
115915 Default BEFVP41-P1 deleted

If you have an « NO PROPOSAL CHOSEN » error, check that the « Phase 2 » encryption algorithms are the same on each side of the VPN Tunnel.

Check « Phase 1 » algorithms if you have this:

115911 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [SA][VID]
115911 Default RECV Informational [NOTIFY] with NO_PROPOSAL_CHOSEN error

4.6 « INVALID ID INFORMATION » error

122623 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [SA][VID]
122625 Default (SA BEFVP41-P1) RECV phase 1 Main Mode [SA][VID]
122625 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [KEY][NONCE]
122626 Default (SA BEFVP41-P1) RECV phase 1 Main Mode [KEY][NONCE]
122626 Default (SA BEFVP41-P1) SEND phase 1 Main Mode [ID][HASH][NOTIFY]
122626 Default (SA BEFVP41-P1) RECV phase 1 Main Mode [ID][HASH][NOTIFY]
122626 Default phase 1 done: initiator id c364cd70: 195.100.205.112, responder id c364cd72: 195.100.205.114, src: 195.100.205.112 dst: 195.100.205.114
122626 Default (SA BEFVP41-BEFVP41-P2) SEND phase 2 Quick Mode [SA][KEY][ID][HASH][NONCE]
122626 Default RECV Informational [HASH][NOTIFY] with INVALID_ID_INFORMATION error
122626 Default RECV Informational [HASH][DEL]
122626 Default BEFVP41-P1 deleted

If you have an « INVALID ID INFORMATION » error, check if « Phase 2 » ID (local address and network address) is correct and match what is expected by the remote endpoint.

Check also ID type (“Subnet address” and “Single address”). If network mask is not check, you are using a IPV4_ADDR type (and not a IPV4_SUBNET type).

4.7 I clicked on “Open tunnel”, but nothing happens.

Read logs of each VPN tunnel endpoint. IKE requests can be dropped by firewalls. An IPSec Client uses UDP port 500 and protocol ESP (protocol 50).

4.8 The VPN tunnel is up but I can’t ping!

If the VPN tunnel is up, but you still cannot ping the remote LAN, here are a few guidelines:

- Check Phase 2 settings: VPN Client address and Remote LAN address. Usually, VPN Client IP address should not belong to the remote LAN subnet
- Once VPN tunnel is up, packets are sent with ESP protocol. This protocol can be blocked by firewall. Check that every device between the client and the VPN server does accept ESP
- Check your VPN server logs. Packets can be dropped by one of its firewall rules.
- Check your ISP support ESP
- If you still cannot ping, follow ICMP traffic on VPN server LAN interface and on LAN computer interface (with Ethereal for example). You will have an indication that encryption works.
- Check the “default gateway” value in VPN Server LAN. A target on your remote LAN can receive pings but does not answer because there is a no “Default gateway” setting.
- You cannot access to the computers in the LAN by their name. You must specify their IP address inside the LAN.
- We recommend you to install ethereal (http://www.ethereal.com) on one of your target computer. You can check that your pings arrive inside the LAN.
