1 Introduction

1.1 Goal of this document

This configuration guide describes how to configure TheGreenBow IPsec VPN Client software with a Palo Alto VPN router to establish VPN connections for remote access to corporate network.

1.2 VPN Network topology

In our VPN network example (diagram hereafter), we will connect TheGreenBow IPsec VPN Client software to the LAN behind the Palo Alto router. The VPN client is connected to the Internet with a DSL connection or through a LAN. All the addresses in this document are given for example purpose.

1.3 Palo Alto Restrictions

No known limitations.

1.4 Palo Alto VPN Gateway

Our tests and VPN configuration have been conducted with Palo Alto firmware release PAN OS 8.

1.5 Palo Alto VPN Gateway product info

It is critical that users find all necessary information about Palo Alto VPN Gateway. All product info, User Guide and knowledge base for the Palo Alto VPN Gateway can be found on the Palo Alto website: https://www.paloaltonetworks.com.

2  Palo Alto VPN configuration

This section describes how to build an IPsec VPN configuration with your Palo Alto VPN router. Once connected to your Palo Alto VPN gateway, you must select “Network” > “GlobalProtect” > “Gateways”.

Create a Gateway configuration

Once done, go to "Agent" tab and
- Enable "Tunnel mode",
- Configure "Tunnel interface"
- Enable "IPSec"
- Enable "X-Auth Support"
- Enable "Skip Auth on IKE Rekey"
- Leave Group Name & Password empty

Make sure the "default" IPSec Cryto profile contains AES128, SHA1, DH2(1024) algorithm.
Once done, go to "Client Settings" tab
- Add a configuration
- In "IP Pools" tab > "IP Pool" >
- Add an IP pool. This IP pool is to distribute Virtual IP address to VPN Clients through Mode-config.

Once done, go to Authentication tab.
Set Global protect authentication and set a Certificate profile.

- Make sure that you have created User Certificate using a CA certificate.
- The CA Certificate should be related to the Certificate profile which we select in above window.
- Make sure that you have created an user in Users database in Palo Alto.
3 TheGreenBow IPsec VPN Client configuration

This section describes the required configuration to connect to a Palo Alto VPN router via VPN connections. To download the latest release of TheGreenBow IPsec VPN Client software, please go to www.thegreenbow.com/vpn_down.html.

3.1 VPN Client Phase 1 (IKE) Configuration

Phase 1 configuration

You may use either Preshared key, Certificates for User Authentication with the Palo Alto router. This configuration is one example of what can be accomplished in term of User Authentication. You may want to refer to either the Palo Alto router user guide or TheGreenBow IPsec VPN Client software User Guide for more details on User Authentication options.
Phase 1 Advanced configuration

- Import the user Certificate generated previously in Palo Alto in VPN Client > Certificate tab
- Enter user name and password created in Palo Alto users database. X-Auth popup can be used to authenticate each time the tunnel opens instead of saving user name and password.
3.2 VPN Client Phase 2 (IPsec) Configuration

Phase 2 Configuration

Enter 0.0.0.0/0.0.0.0 to pass all traffic through tunnel
3.3 Open IPsec VPN tunnels

Once both Palo Alto router and TheGreenBow IPsec VPN Client software have been configured accordingly,
you are ready to open VPN tunnels. First make sure you enable your firewall with IPsec traffic.

1/ Click on "Save & Apply" to take into account all modifications we've made on your VPN Client
   configuration.

2/ Click on "Open Tunnel", or generate traffic that will automatically open a secure IPsec VPN Tunnel (e.g.
   ping, IE browser).

3/ Select "Connections" to see opened VPN Tunnels.

4/ Select "Console" if you want to access to the IPsec VPN logs and adjust filters to display less IPsec
   messaging. The following example shows a successful connection between TheGreenBow IPsec VPN
   Client and a Palo Alto VPN router.

```
20110215 141513 Default phase 1 done: initiator id /C=fr/ST=idf/L=paris/O=bloodzel@nd/OU=seri
20110215 141513 Default (SA gateway1-tunnel1-P2) SEND phase 2 Quick Mode [HASH] [SA] [IN
20110215 141514 Default (SA gateway1-tunnel1-P2) RECV phase 2 Quick Mode [HASH] [SA] [IN
20110215 141514 Default (SA gateway1-tunnel1-P2) SEND phase 2 Quick Mode [HASH]
20110215 141524 Default (SA gateway1-P1) RECEV Informational [HASH] [NOTIFY] type DPD_R_  
20110215 141524 Default (SA gateway1-P1) SEND Informational [HASH] [NOTIFY] type DPD_R_  
20110215 141534 Default (SA gateway1-P1) SEND Informational [HASH] [DELETE]             
20110215 141534 Default <gateway1-tunnel1-P2> deleted
20110215 141534 Default (SA gateway1-P1) SEND Informational [HASH] [DELETE]             
```
4 Tools in case of trouble

Configuring an IPsec VPN tunnel can be a hard task. One missing parameter can prevent a VPN connection from being established. Some tools are available to find source of troubles during a VPN establishment.

4.1 A good network analyser: Wireshark

Wireshark is a free software that can be used for packet and traffic analysis. It shows IP or TCP packets received on a network card. This tool is available on website [www.wireshark.org](http://www.wireshark.org). It can be used to follow protocol exchange between two devices. For installation and use details, read its specific documentation ([www.wireshark.org/docs/](http://www.wireshark.org/docs/)).
5 VPN IPsec Troubleshooting

5.1 “PAYLOAD MALFORMED” error (wrong Phase 1 [SA])

If you have an “PAYLOAD MALFORMED” error you might have a wrong Phase 1 [SA], check if the encryption algorithms are the same on each side of the VPN tunnel.

5.2 “INVALID COOKIE” error

If you have an “INVALID COOKIE” error, it means that one of the endpoint is using a SA that is no more in use. Reset the VPN connection on each side.

5.3 “no keystate” error

Check if the preshared key is correct or if the local ID is correct (see “Advanced” button). You should have more information in the remote endpoint logs.

5.4 “received remote ID other than expected” error

The “Remote ID” value (see “Advanced” Button) does not match what the remote endpoint is expected.
5.5 “NO PROPOSAL CHOSEN” error

If you have an “NO PROPOSAL CHOSEN” error, check that the “Phase 2” encryption algorithms are the same on each side of the VPN Tunnel.

Check “Phase 1” algorithms if you have this:

5.6 “INVALID ID INFORMATION” error

If you have an “INVALID ID INFORMATION” error, check if “Phase 2” ID (local address and network address) is correct and match what is expected by the remote endpoint.

Check also ID type (“Subnet address” and “Single address”). If network mask is not check, you are using a IPV4_ADDR type (and not a IPV4_SUBNET type).

5.7 I clicked on “Open tunnel”, but nothing happens.

Read logs of each VPN tunnel endpoint. IKE requests can be dropped by firewalls. An IPsec Client uses UDP port 500 and protocol ESP (protocol 50).
5.8 The VPN tunnel is up but I can’t ping!

If the VPN tunnel is up, but you still cannot ping the remote LAN, here are a few guidelines:

- Check Phase 2 settings: VPN Client address and Remote LAN address. Usually, VPN Client IP address should not belong to the remote LAN subnet.
- Once VPN tunnel is up, packets are sent with ESP protocol. This protocol can be blocked by firewall. Check that every device between the client and the VPN server does accept ESP.
- Check your VPN server logs. Packets can be dropped by one of its firewall rules.
- Check your ISP support ESP.
- If you still cannot ping, follow ICMP traffic on VPN server LAN interface and on LAN computer interface (with Wireshark for example). You will have an indication that encryption works.
- Check the "default gateway" value in VPN Server LAN. A target on your remote LAN can receive pings but does not answer because there is a no “Default gateway” setting.
- You cannot access to the computers in the LAN by their name. You must specify their IP address inside the LAN.
- We recommend you to install Wireshark (www.wireshark.org) on one of your target computer. You can check that your pings arrive inside the LAN.
