1 Introduction

1.1 Goal of this document

This configuration guide describes how to configure TheGreenBow IPSec VPN Client software with an Astaro Security Gateway to establish VPN connections for remote access to corporate network

1.2 VPN Network topology

In our VPN network example (diagram hereafter), we will connect TheGreenBow IPSec VPN Client software to the LAN behind the Astaro Security Gateway. The VPN client is connected to the Internet with a DSL connection or through a LAN. All the addresses in this document are given for example purpose.

1.3 Astaro Security Gateway Restrictions

There are no known restrictions regarding the Astaro Security Gateway. Please make sure you use one of the latest firmware releases from Astaro. You can see your firmware version on the main site (Dashboard). For more details visit <http://www.astaro.de>.

1.4 Astaro Security Gateway

Our tests and VPN configuration have been conducted with an Astaro Security Gateway 120 and a firmware release 7.504 (Astaro Security Gateway V7).

1.5 Astaro Security Gateway product info

It is critical that users find all necessary information about Astaro Security Gateways. All product info, User Guide and knowledge base for the Astaro Security Gateway can be found on the Astaro website: <http://www.astaro.de>.

Astaro Product page	http://www.astaro.com/de-de?no-geo=1
Astaro User Guide	http://www.astaro.com/sites/default/files/supportmaterial/Astaro_V7_Quick_Start_Guide.pdf
Astaro FAQ/Help	https://support.astaro.com/support/index.php/Main_Page

2 Astaro Security Gateway VPN configuration

This section describes how to build an IPSec VPN configuration with your Astaro Security Gateway.

2.1 Preparations

To connect to your Astaro Security Gateway from the internet by a host or domain name, you might configure a dynamic name resolution service. You will find more detailed information about this topic in your Astaro documentation or on the user guide website: <http://www.astaro.de>.

2.2 Astaro Security Gateway configuration

Once connected to your Astaro Security Gateway administration interface, you must select “**Remote Access**”.

The screenshot shows the Astaro Security Gateway v7 dashboard. The top bar displays the Astaro logo, the model name "Astaro Security Gateway v7", the admin user "admin", and the IP address "192.168.11.111". The dashboard is titled "Dashboard for Sat Jun 5 01:42:18 2010".

- remote.iskra-ae.de**: Model: ASG120, Serial: 001110, License ID: Subscriptions: Net Security, Uptime: 59d 11h 6m.
- Version information**: Firmware version: 7.504, 1 Update(s) available for installation, Pattern version: 12561, Last check: 11 minutes ago.
- Resource usage**: CPU (28%), RAM (34% of 995.1 MB), Swap (0% of 1.0 GB), Log Disk (2% of 15.5 GB), Data Disk (3% of 11.8 GB).
- Todays threat status**: Firewall: 187 packets filtered, IPS: 0 attacks blocked, AntiVirus: 0 items blocked, AntiSpam: 37 emails blocked, AntiSpyware: 0 items blocked, Web Filter: 0 URLs filtered.
- Network ports** (Table):

Port	Name	Type	State	Link	In	Out
eth0	Internal	Ethernet	Up	Up	1.9 kbit	0.7 kbit
eth1	External	Ethernet	Up	Up	5.8 kbit	17.9 kbit
eth2						
- Current system configuration** (List):
 - Firewall is active with 12 rules
 - Intrusion Prevention is inactive
 - IM/P2P Control is active
 - HTTP/S Proxy is active, 15 requests served today*
 - FTP Proxy *
 - SMTP Proxy is active, 53 emails processed, 37 emails blocked*
 - POP3 Proxy *
 - AntiVirus is active for protocols HTTP*, SMTP*
 - AntiSpam is active for protocols SMTP*
 - AntiSpyware is active*
 - Email Encryption *
 - Site2Site VPN is inactive
 - Remote Access is active with 0 online users
 - HA/Cluster is inactive
- Astaro News**: Find My Firewall. Text: All ASG's are equipped with a built-in Dynamic DNS Client. This service allows the ASG to update a hostname with its currently assigned IP address automatically. If you get a dynamic address from your ISP, using DynDNS allows you to "find" your ASG. Make a free account at www.dyndns.org, then set up the parameters from Network Services->DNS-->DynDNS. Now your chosen hostname (e.g. myasg.dyndns.org) will always resolve to your current IP. This is great for using things like Remote Access or WebAdmin, since you don't know what the address has changed to recently.

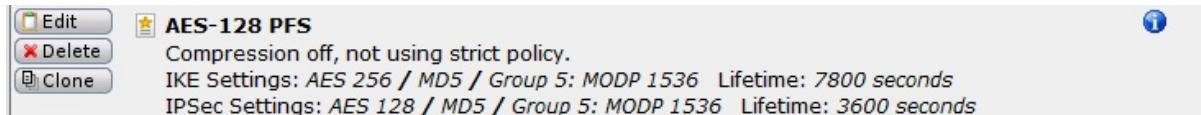

Select “**IPSec**” in the submenu:

The screenshot shows the "Remote Access" submenu. The "IPSec" option is highlighted with a yellow arrow. Other options include SSL, PPTP, L2TP over IPSec, Cisco™ VPN Client, Advanced, and Certificate Management.

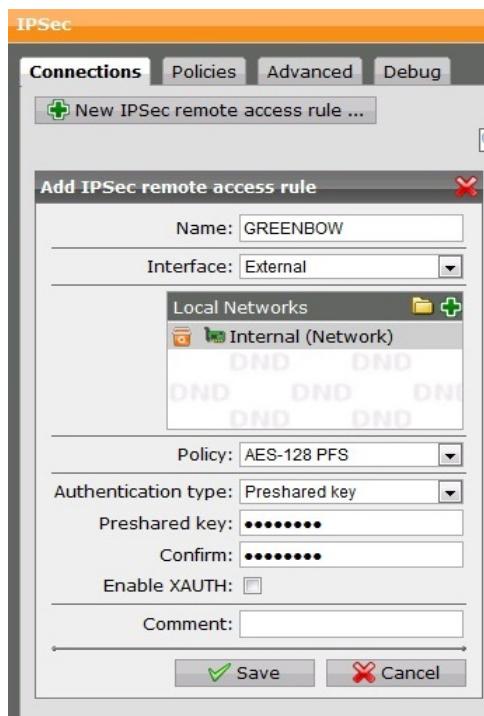

Select the tab „**Connections**“, and choose „**New IPSec remote access rule**“. In the window „**Add IPSec remote access rule**“ enter a name (e.g. „GREENBOW“) for this tunnel configuration. Choose an „**Interface**“ and select „**External**“ from the list. At „**Local Networks**“ select the internal interface „**Internal (Network)**“ with a click on the directory symbol). At „**Policy**“ you can select a IPSec Security Policy (e.g. **AES-128 PFS** – Policy settings see

THEGREENBOW	Doc.Ref	tgbvpn-cg-astaro-security-gateway-en
	Doc.version	1.0 – Jun 2010
	VPN version	4.6x

pictures below). The Astaro Security Gateway offers premade IPSec Security Policies (see tab „**Policies**“), you can as well define custom IPSec Security Policies

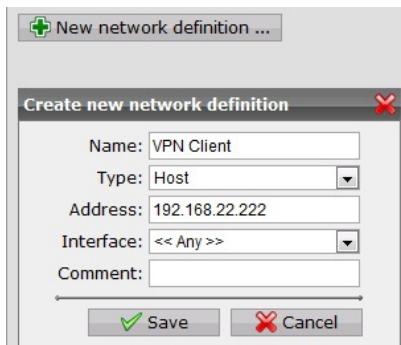

Please select „**Preshared key**“ as authentication type. Here you can enter the pre-shared key. Now click „Save“ to apply the changes.

To have a successful VPN connection, it's mandatory to configure a firewall rule which defines a virtual VPN Client IP address.

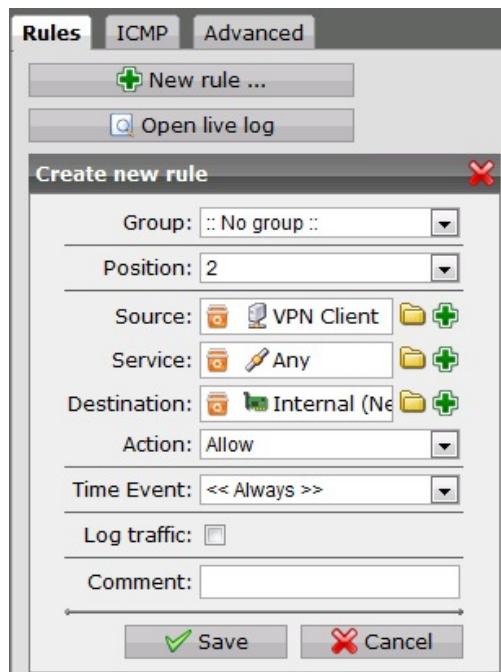

On the main administration site, select the menu option „**Definitions**“. Select „**Networks**“ from the submenu and click on „**New network definition...**“. Now select „**Create new network definition**“ and define a name (e.g. „**VPN Client**“). Select „**Host**“ as type and enter an IP address (this IP address must not belong to the local subnet, here **192.168.22.222**). For „**Interface**“, select „**<<Any>>**“ Apply the settings by clicking „**Save**“.

On the main administration site, select the menu option „**Network Security**“. Select „**Packer Filter**“ from the submenu. Select the tab „**Rules**“ and click „**New rule...**“. In the window „**Create new rule**“ do the following settings:

Leave the value for „**Group**“ on „**No group**“. You can select the order and position of the firewall rule (in our example „**2**“). As **source** (click on the directory symbol) apply the already made network definition „**VPN Client**“.

For „Service“ and „Destination“ select „Any“ and „Internal (Network)“. „Action“ must be „Allow“ and „Time Event“ can be „Always“. Apply settings by clicking „Save“.

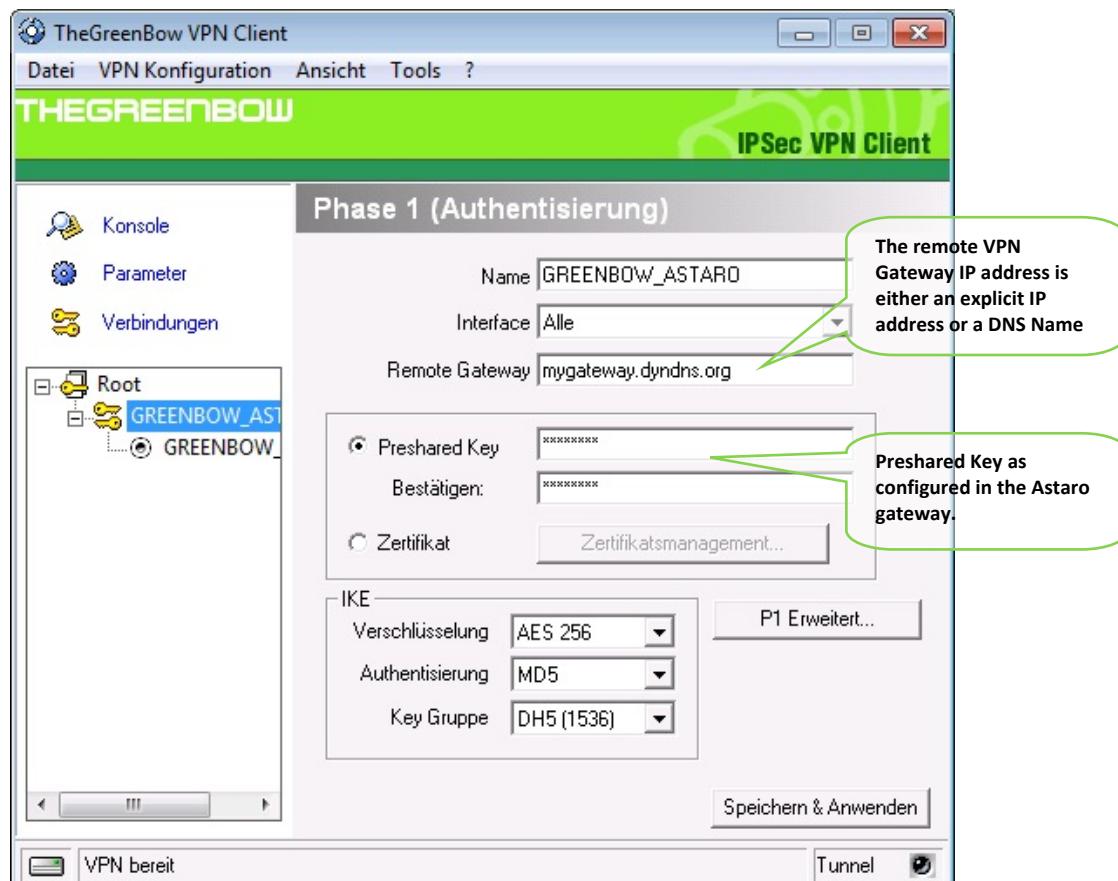

The settings for the Astaro Security Gateway are now completed.

3 TheGreenBow IPSec VPN Client configuration

This section describes the required configuration to connect to an Astaro Security Gateway via VPN connections.

To download the latest release of TheGreenBow IPSec VPN Client software, please go to
http://www.thegreenbow.com/vpn_down.html.

3.1 VPN Client Phase 1 (IKE) Configuration

Phase 1 configuration

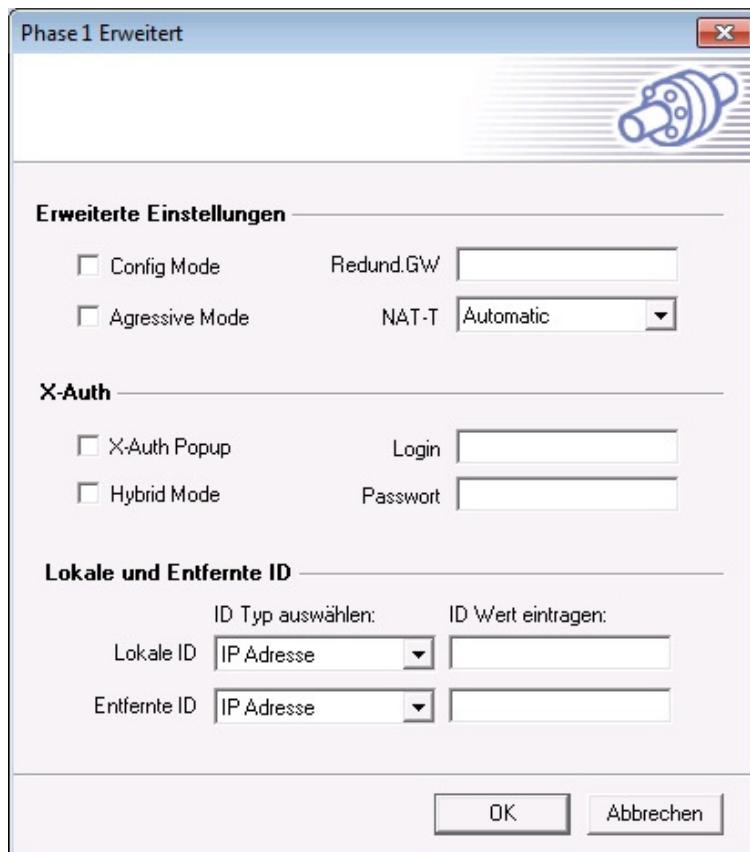

To authenticate the user, in this example we're using Preshared Key.

Enter a name for your VPN connection, e.g. GREENBOW_ASTARO. Enter your gateway host name or IP address and leave Interface to "all". Please match the values of the IKE section with the settings you have already done on the Astaro.

You may as well use either Preshared key, Certificates, USB Tokens, OTP Token (One Time Password) or X-Auth standalone or combined with RADIUS Server for User Authentication with your Astaro Security Gateway. This configuration is one example of what can be accomplished in term of User Authentication. You may want to refer to either the Astaro Security Gateway user guide or TheGreenBow IPSec VPN Client software User Guide for more details on different User Authentication options.

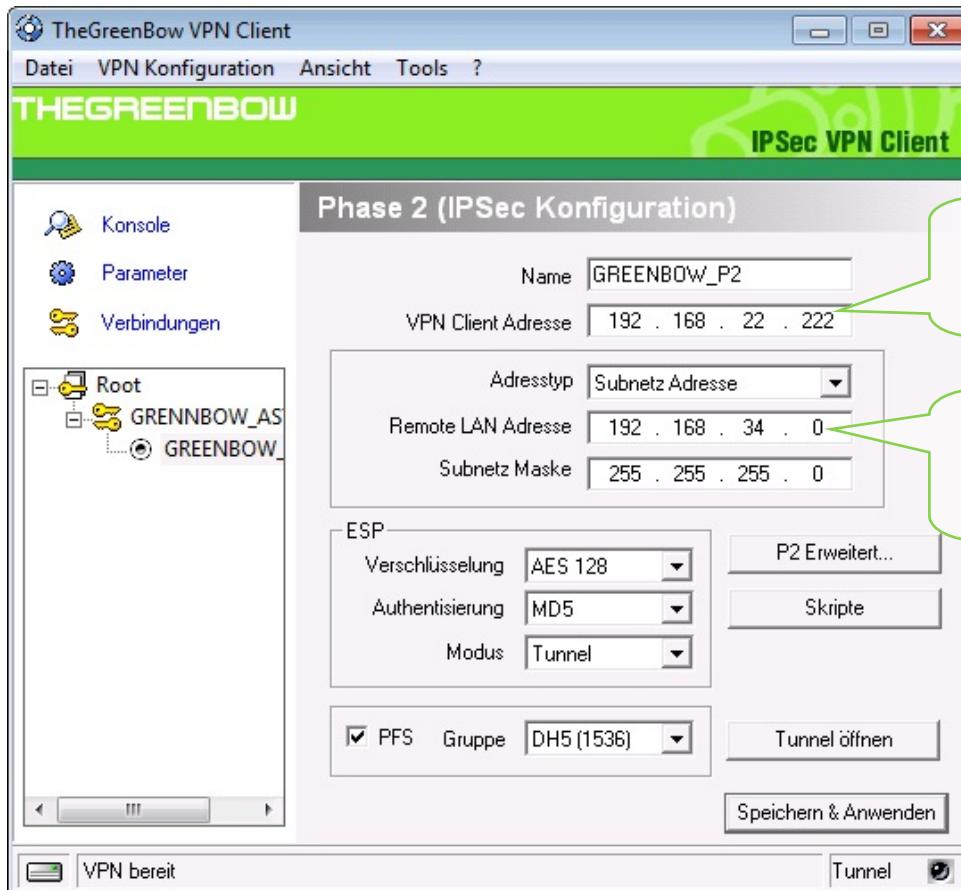

3.2 Phase 1 Advanced settings

Click the button "P1 Advanced" to adjust more settings.

As local and remote ID type, select IP address. The ID values can be left blank. Apply changes with a click on "OK".

3.3 VPN Client Phase 2 (IPSec) Configuration

Phase 2 Configuration

Klick "Save & Apply" to save all configuration settings.

3.4 Open IPSec VPN tunnels

Once both Astaro Security Gateway and TheGreenBow IPSec VPN Client software have been configured accordingly, you are ready to open VPN tunnels. First make sure you enable your firewall with IPSec traffic.

1. Click on "**Save & Apply**" to take into account all modifications we've made on your VPN Client configuration
2. Click on "**Open Tunnel**", or generate traffic that will automatically open a secure IPSec VPN Tunnel (e.g. ping, IE browser). Once the tunnel starts, a popup window will ask you for your user name and password.
3. Select "**Connections**" to see opened VPN Tunnels
4. Select "**Console**" if you want to access to the IPSec VPN logs and adjust filters to display less IPSec messaging. The following example shows a successful connection between TheGreenBow IPSec VPN Client and a Astaro Security Gateway.

```

20090630 104525 Default (SA Gateway2-P1) SEND phase 1 Main Mode [SA][VID][VID][VID][VID]
20090630 104525 Default (SA Gateway2-P1) RECV phase 1 Main Mode [SA][VID][VID]
20090630 104526 Default (SA Gateway2-P1) SEND phase 1 Main Mode [KEY_EXCH][NONCE][NAT_D][NAT_D]
20090630 104526 Default (SA Gateway2-P1) RECV phase 1 Main Mode [KEY_EXCH][NONCE][NAT_D][NAT_D]
20090630 104526 Default (SA Gateway2-P1) SEND phase 1 Main Mode [HASH][ID][NOTIFY]
20090630 104526 Default (SA Gateway2-P1) RECV phase 1 Main Mode [HASH][ID]
20090630 104526 Default phase 1 done: initiator id 192.168.205.151, responder id mygateway.dyndns.org
20090630 104526 Default (SA Gateway2-Tunnel3-P2) SEND phase 2 Quick Mode [HASH][SA][KEY_EXCH][NONCE][ID][ID]
20090630 104527 Default (SA Gateway2-Tunnel3-P2) RECV phase 2 Quick Mode [HASH][SA][KEY_EXCH][NONCE][ID][ID]
20090630 104527 Default (SA Gateway2-Tunnel3-P2) SEND phase 2 Quick Mode [HASH]
20090630 104555 Default (SA Gateway2-P1) SEND Informational [HASH][NOTIFY] type DPD_R_U_THERE
20090630 104555 Default (SA Gateway2-P1) RECV Informational [HASH][NOTIFY] type DPD_R_U_THERE_ACK

```

Doc.version	1.0 – Jun 2010
VPN version	4.6x

4 Tools in case of trouble

Configuring an IPSec VPN tunnel can be a hard task. One missing parameter can prevent a VPN connection from being established. Some tools are available to find source of troubles during a VPN establishment.

4.1 A good network analyser: Wireshark

Wireshark is a free software that can be used for packet and traffic analysis. It shows IP or TCP packets received on a network card. This tool is available on website <http://www.wireshark.org>. It can be used to follow protocol exchange between two devices. For installation and use details, read its specific documentation (<http://www.wireshark.org/docs/>).

Doc.Ref	tgbvpn-cg-astaro-security-gateway-en
Doc.version	1.0 – Jun 2010
VPN version	4.6x

5 VPN IPSec Troubleshooting

5.1 « PAYLOAD MALFORMED » error (wrong Phase 1 [SA])

```
114920 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [SA] [VID]
114920 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [NOTIFY]
114920 Default exchange_run: exchange_validate failed
114920 Default dropped message from 195.100.205.114 port 500 due to notification
type PAYLOAD_MALFORMED
114920 Default SEND Informational [NOTIFY] with PAYLOAD_MALFORMED error
```

If you have an « PAYLOAD MALFORMED » error you might have a wrong Phase 1 [SA], check if the encryption algorithms are the same on each side of the VPN tunnel.

5.2 « INVALID COOKIE » error

```
115933 Default message_recv: invalid cookie(s) 5918ca0c2634288f 7364e3e486e49105
115933 Default dropped message from 195.100.205.114 port 500 due to notification
type INVALID_COOKIE
115933 Default SEND Informational [NOTIFY] with INVALID_COOKIE error
```

If you have an « INVALID COOKIE » error, it means that one of the endpoint is using a SA that is no more in use. Reset the VPN connection on each side.

5.3 « no keystate » error

```
115315 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [SA] [VID]
115317 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [SA] [VID]
115317 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [KEY] [NONCE]
115319 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [KEY] [NONCE]
115319 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [ID] [HASH] [NOTIFY]
115319 Default ipsec get keystate: no keystate in ISAKMP SA 00B57C50
```

Check if the preshared key is correct or if the local ID is correct (see « Advanced » button). You should have more information in the remote endpoint logs.

5.4 « received remote ID other than expected » error

```
120348 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [SA] [VID]
120349 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [SA] [VID]
120349 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [KEY] [NONCE]
120351 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [KEY] [NONCE]
120351 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [ID] [HASH] [NOTIFY]
120351 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [ID] [HASH] [NOTIFY]
120351 Default ike_phase_1_recv_ID: received remote ID other than expected
support@thegreenbow.fr
```

The « Remote ID » value (see « Advanced » Button) does not match what the remote endpoint is expected.

Doc.Ref	tgbvpn-cg-astaro-security-gateway-en
Doc.version	1.0 – Jun 2010
VPN version	4.6x

5.5 « NO PROPOSAL CHOSEN » error

```
115911 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [SA] [VID]
115913 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [SA] [VID]
115913 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [KEY] [NONCE]
115915 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [KEY] [NONCE]
115915 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [ID] [HASH] [NOTIFY]
115915 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [ID] [HASH] [NOTIFY]
115915 Default phase 1 done: initiator id c364cd70: 195.100.205.112, responder id
c364cd72: 195.100.205.114, src: 195.100.205.112 dst: 195.100.205.114
115915 Default (SA CNXVPN1-CNXVPN1-P2) SEND phase 2 Quick Mode
[SA] [KEY] [ID] [HASH] [NONCE]
115915 Default RECV Informational [HASH] [NOTIFY] with NO_PROPOSAL_CHOSEN error
115915 Default RECV Informational [HASH] [DEL]
115915 Default CNXVPN1-P1 deleted
```

If you have an « NO PROPOSAL CHOSEN » error, check that the « Phase 2 » encryption algorithms are the same on each side of the VPN Tunnel.

Check « Phase 1 » algorithms if you have this:

```
115911 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [SA] [VID]
115911 Default RECV Informational [NOTIFY] with NO_PROPOSAL_CHOSEN error
```

5.6 « INVALID ID INFORMATION » error

```
122623 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [SA] [VID]
122625 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [SA] [VID]
122625 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [KEY] [NONCE]
122626 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [KEY] [NONCE]
122626 Default (SA CNXVPN1-P1) SEND phase 1 Main Mode [ID] [HASH] [NOTIFY]
122626 Default (SA CNXVPN1-P1) RECV phase 1 Main Mode [ID] [HASH] [NOTIFY]
122626 Default phase 1 done: initiator id c364cd70: 195.100.205.112, responder id
c364cd72: 195.100.205.114, src: 195.100.205.112 dst: 195.100.205.114
122626 Default (SA CNXVPN1-CNXVPN1-P2) SEND phase 2 Quick Mode
[SA] [KEY] [ID] [HASH] [NONCE]
122626 Default RECV Informational [HASH] [NOTIFY] with INVALID_ID_INFORMATION error
122626 Default RECV Informational [HASH] [DEL]
122626 Default CNXVPN1-P1 deleted
```

If you have an « INVALID ID INFORMATION » error, check if « Phase 2 » ID (local address and network address) is correct and match what is expected by the remote endpoint.

Check also ID type (“Subnet address” and “Single address”). If network mask is not check, you are using a IPV4_ADDR type (and not a IPV4_SUBNET type).

5.7 I clicked on “Open tunnel”, but nothing happens.

Read logs of each VPN tunnel endpoint. IKE requests can be dropped by firewalls. An IPSec Client uses UDP port 500 and protocol ESP (protocol 50).

5.8 The VPN tunnel is up but I can't ping !

If the VPN tunnel is up, but you still cannot ping the remote LAN, here are a few guidelines:

- Check Phase 2 settings: VPN Client address and Remote LAN address. Usually, VPN Client IP address should not belong to the remote LAN subnet
- Once VPN tunnel is up, packets are sent with ESP protocol. This protocol can be blocked by firewall. Check that every device between the client and the VPN server does accept ESP
- Check your VPN server logs. Packets can be dropped by one of its firewall rules.
- Check your ISP support ESP

Doc.Ref	tgbvpn-cg-astaro-security-gateway-en
Doc.version	1.0 – Jun 2010
VPN version	4.6x

- If you still cannot ping, follow ICMP traffic on VPN server LAN interface and on LAN computer interface (with Wireshark for example). You will have an indication that encryption works.
- Check the “default gateway” value in VPN Server LAN. A target on your remote LAN can receive pings but does not answer because there is no “Default gateway” setting.
- You cannot access to the computers in the LAN by their name. You must specify their IP address inside the LAN.
- We recommend you to install Wireshark (<http://www.wireshark.org>) on one of your target computer. You can check that your pings arrive inside the LAN.
